

With CVap® Ovens, you don't have to worry about hood space or placement.

Save thousands by omitting an unneeded hood from your floor plan.

Independent lab Intertek tested our CVap ovens, using the EPA's **Method 202 Condensible Particulate Matter** standard. The Intertek test data proved that Winston's CVap ovens release grease emissions at a level that allows them to safely operate hoodless. EPA regulations specify that grease emissions from cooking appliances can't exceed 5.0 mg (milligrams) per 3 cubic meters. Intertek testing showed that the grease emissions from our RTV5 oven were 0.265 mg per 3 cubic meters, well below the 5.0 mg limit. The report concludes that this data is acceptable for all Winston CVap RTV, CHV, and HOV models.
